Summary

Software Engineer specializing in multi-tenant travel platforms. Built and architected Laravel-based systems for flight aggregation (25+ suppliers), resilient multi-provider payment gateways, dynamic pricing, and automated infrastructure provisioning. Experienced in AWS, OpenToFu, observability, and modernizing legacy systems with a strong focus on reliability, scalability, and data integrity.

Professional Experience

LuxOTA Travel Tech

2026 Feb | Dubai, United Arab Emirates

Software Engineer

- **Designed and adopted an AI-native engineering workflow across frontend, backend, and infrastructure using Codex and Claude Code**, building a structured system of **rules, architectural context, reusable skills, and verification workflows** that enabled AI agents to work effectively within a complex production codebase; integrated agents into **implementation, review, debugging, refactoring, testing, and infrastructure workflows** while maintaining human oversight and engineering standards.
- **Built Trustee, a double-entry accounting system in Laravel** that tracks **per-passenger fees charged to travel agencies** and calculates associated **tax liabilities**, with a focus on **data integrity, consistency, auditability, and financial correctness**.
- **Designed and maintained AWS infrastructure** for a **travel platform** using **OpenTofu/Terraform**, provisioning **ECS Fargate, Aurora, and S3** with per-environment state isolation and versioned infrastructure modules; owned the **end-to-end deployment pipeline** with **secure secrets management, deployment safety gates, high availability, scalability, and centralized CloudWatch logging**.
- **Built an automated node-provisioning API** for a multi-tenant Laravel platform, orchestrating **12 sequential provisioning steps**—tenant creation, DNS/SSL, Nginx/load-balancer configuration, database migrations, and plugin allocation—from a single authenticated request; replaced a manual workflow with **idempotent, fault-tolerant, self-recovering provisioning**, reducing setup time by **~99%** and preventing partially configured nodes.
- **Containerized a legacy multi-service platform with no reproducible local environment**, bringing **10+ services into a single Docker Compose stack** with dependency health checks, automated migrations, and Xdebug support; established **reproducible, consistent development environments** and reduced onboarding from **days of manual setup to a single command**.
- **Designed and implemented centralized observability for Luxota's services**, building a Filebeat → Logstash → Elasticsearch pipeline with **correlation IDs propagated across service boundaries**; enabled **end-to-end distributed tracing, centralized logging, and faster incident diagnosis** across a multi-service environment.

Ghasedak24 (Travel Company)

2022 Nov – 2026 Feb | Tehran, Iran

Software Engineer

- Designed and built a **high-scale SaaS flight aggregation platform from 0 to 1 on Laravel**, integrating **25+ suppliers** across the **full booking lifecycle (search → revalidation → book → issue → refund)**; architected for **high availability, scalability, low latency, and fault isolation** and driving **significant growth in engagement and sales**.
- **Designed and developed a scalable dynamic pricing service for B2C and B2B products**, enabling configurable **ticket pricing and markup strategies at the product level**; architected for **low latency, high availability, and horizontal scalability** to support real-time pricing decisions at scale.
- **Architected and built a scalable multi-tenant payment gateway (Daric)**, integrating **8+ payment providers** across the **end-to-end payment lifecycle**, including payment initiation, verification, callbacks/webhooks, settlement, and refunds; designed for **high availability, scalability, fault tolerance, low latency, and idempotent processing**, implementing **timeouts, retries, circuit breakers, fault isolation, and reliable webhook delivery** to ensure resilient and consistent payment processing across heterogeneous provider APIs.
- **Successfully led cross-functional teams in transitioning legacy systems to modern, maintainable architectures**, significantly **reducing technical debt** and improving long-term code quality.

- **Architected and developed the train platform** for the **full train service lifecycle**—search, revalidation, booking, and issuance—designing for **high availability, fault tolerance, resilience, and low latency**; implemented **timeouts, circuit breakers, controlled retries, and failure isolation** to protect against provider failures and prevent cascading failures, supporting **432K+ requests/day with traffic peaking at 3× average volume**.
- **Led the migration of the custom blog platform from CodeIgniter 2 to WordPress**, replacing unnecessary in-house functionality with a mature CMS and giving **SEO and content teams purpose-built tools and workflows**, reducing engineering overhead and improving content publishing efficiency.

Adam Barfi (Digital Marketing)

FullStack Developer

2020 Jan – 2022 Oct | Tehran, Iran

- **Developed and maintained full-stack web applications and websites** using **Laravel, PHP, React, and WordPress**, handling both backend and frontend development.
- **Designed and developed custom WordPress themes** for multiple clients, delivering **responsive, SEO-friendly, and highly customized websites** tailored to their branding and business requirements.
- **Built a multi-tenant online menu platform for coffee shops**, enabling multiple businesses to independently manage their **menus, products, pricing, and content** through a shared platform.
- **Built custom CMS functionality and website features** to streamline content management and publishing workflows for non-technical users.
- **Extended the Chatify package** for AndamBartar with **voice messaging and voice-command functionality**, enhancing the platform's real-time communication experience.

Skills

LANGUAGES (PHP, C#) | DATABASES (MySQL, Redis, PostgreSQL) | TECHNOLOGY & FRAMEWORKS (Laravel, CodeIgniter, .NET, Symfony) | CONTAINERIZATION (Docker) | PRINCIPLES (OOP, SOLID, KISS, YAGNI, PSR, SoC) | Architecture (Modular, MVC, Layered Architecture, Hexagonal Architecture (Ports and Adapters), Domain-Driven Design (DDD), Service-Oriented Architecture (SOA), Clean Architecture) | ELK | FRONTEND (NEXT, REACT)

Education

Qazvin Islamic Azad University

Bachelor's degree English Translation

2024 Oct – present | Qazvin, Iran

Languages

- English
- Persian
